

## POSSIBLE CAUSES FOR PLANT NUTRIENT LEVELS ABOVE OR BELOW THE SUFFICIENCY LEVEL

---

	<b>Above Sufficiency Level</b>	<b>Below Sufficiency Level</b>
<b>NITROGEN (N)</b>	<ol style="list-style-type: none"> <li>1) Excessive application of nitrogen fertilization</li> <li>2) High rate of nitrification at the time</li> <li>3) Shortage of other elements</li> </ol>	<ol style="list-style-type: none"> <li>1) Inadequate nitrogen fertilization</li> <li>2) Low nitrification rate or perhaps denitrification</li> <li>3) Low soil phosphorus level</li> </ol>
<b>PHOSPHORUS (P)</b>	<ol style="list-style-type: none"> <li>1) High soil phosphorus</li> <li>2) Excessive application of phosphate fertilizers</li> <li>3) High soil pH (7.5)</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil phosphorus level or inadequate phosphorus fertilization</li> <li>2) Wet soils</li> <li>3) Low soil pH (5.5)</li> <li>4) Low organic activity in soil</li> </ol>
<b>POTASSIUM (K)</b>	<ol style="list-style-type: none"> <li>1) High soil potassium level or excessive application of potassium fertilizers</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil potassium level or inadequate potassium fertilization for crop needs</li> </ol>
<b>SULFUR (S)</b>	<ol style="list-style-type: none"> <li>1) Excessive available soil sulfate level from natural or applied sources</li> </ol>	<ol style="list-style-type: none"> <li>1) Low available soil sulfate level</li> <li>2) Excessive available nitrogen in low organic matter soils</li> <li>3) Inadequate sulfate fertilization or excessive leaching of sulfates</li> <li>4) Low organic activity in soil</li> </ol>
<b>MAGNESIUM (Mg)</b>	<ol style="list-style-type: none"> <li>1) Diseased or dead tissue</li> <li>2) Poor K availability</li> <li>3) Old plant tissue in sample</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil magnesium level (can be due to low soil pH, continuous use of high calcium lime on low magnesium soils, or naturally calcareous soils low in Mg)</li> <li>2) High soil nitrogen availability</li> <li>3) Low calcium availability</li> </ol>
<b>CALCIUM (Ca)</b>	<ol style="list-style-type: none"> <li>1) Diseased or dead tissue</li> <li>2) Old plant tissue sample</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil calcium level (can be due to low soil pH or highly leached, low exchange capacity soils)</li> <li>2) Low soil potassium levels in plant tissue</li> <li>3) High soil nitrogen availability</li> </ol>

	<b>Above Sufficiency Level</b>	<b>Below Sufficiency Level</b>
<b>IRON (Fe)</b>	<ol style="list-style-type: none"> <li>1) Reduced soil conditions from very wet or flooded soils</li> <li>2) Zinc deficiency</li> <li>3) Soil or dust contamination</li> </ol>	<ol style="list-style-type: none"> <li>1) High soil pH</li> <li>2) Excessive zinc, phosphate, copper or manganese availability</li> </ol>
<b>MANGANESE (Ma)</b>	<ol style="list-style-type: none"> <li>1) High nitrogen or phosphorus applications on acid, low organic soil</li> <li>2) Low soil pH</li> <li>3) Soil or dust contamination</li> <li>4) Contamination from certain fungicide sprays</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil manganese content</li> <li>2) Low natural soil manganese content</li> <li>3) Low availability due to high soil pH (7.0 or above), high soil moisture and very low organic matter content</li> </ol>
<b>BORON (B)</b>	<ol style="list-style-type: none"> <li>1) Excessive or improper boron fertilization</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil availability (can be caused by high soil pH or high leached sandy soils, or low organic matter soils)</li> </ol>
<b>COPPER (Cu)</b>	<ol style="list-style-type: none"> <li>1) High soil copper content (may be caused by previous year's pesticide sprays or dust now contained in soil)</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil availability (associated with high soil pH, high organic matter content, high concentrations of iron and manganese, and highly leached soils)</li> </ol>
<b>ZINC (Zn)</b>	<ol style="list-style-type: none"> <li>1) High soil pH</li> <li>2) Contamination from brass</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil content</li> <li>2) Low soil availability (due to leached soils, soil pH, high phosphorus, areas with low organic matter content or certain muck soils)</li> </ol>
<b>MOLYBDENUM (Mo)</b>	<ol style="list-style-type: none"> <li>1) High soil pH</li> <li>2) Potassium deficiency in some cases</li> </ol>	<ol style="list-style-type: none"> <li>1) Low soil pH (5.5)</li> <li>2) High phosphate levels</li> </ol>
<b>SODIUM (Na)</b>	<ol style="list-style-type: none"> <li>1) High sodium content in soils</li> </ol>	<ol style="list-style-type: none"> <li>1) Seldom, if ever, deficient except possibly for sugar beets or spinach</li> </ol>
<b>ALUMINUM (Al)</b>	<ol style="list-style-type: none"> <li>1) Low soil pH</li> <li>2) Reduced conditions associated with wet or flooded soils</li> <li>3) Soil or dust contamination</li> </ol>	<ol style="list-style-type: none"> <li>1) Cannot be deficient (not an essential element)</li> </ol>
